LeadRevive — Business operations case study

SYNTHETIC portfolio case | Snapshot 9a80207b950500a9 | Revision d0b3c2463213

Evaluated 2026-10-24T15:44:29.684236Z. All stored creation dates through evaluation time. Current-state reporting.

Problem and decision

A B2B services team needs to see unowned enquiries, late first responses and missed next actions. The system helps a manager assign work and prioritize follow-up; it does not establish that overdue leads are lost sales.

Method and cohort

PostgreSQL is canonical. Independent SQL and Python calculations reconcile before publication; CSV/Excel are read back. Power BI aggregates the derived facts. Cohort: 758 leads (754 seed records; 4 controlled fixtures).

Measure	Snapshot value
Leads in cohort	758
First contacted	574
Uncontacted	184
Current Won	64
Ever qualified	383
Open with scheduled action	586
Overdue follow-up	411
First-response coverage	75.7%
Lead-to-qualified rate	50.5%
Lead-to-win rate	8.4%
Overdue / scheduled open	70.1%
Median first response (hours)	59
Estimated pipeline exposure (INR)	104,279,000

Findings and recommended actions

Referral has the largest overdue count in this cohort: 94, with INR 23,704,000 estimated exposure. Review cohort age and capacity before changing source spend.

24 overdue leads are unassigned, representing INR 6,390,000 estimated exposure. Owner reminders cannot resolve missing ownership.

Elapsed-hour SLA: 119 met, 637 breached and 2 awaiting within SLA. The response median excludes 184 uncontacted leads.

Automation and evidence

Four workflows cover intake, recovery, approval-controlled outbox and status sync. Internal owner reminders are automated; customer-preview approval is manual and bound to exact content/version. External live delivery disabled.

All-time local test ledger (not the selected lead cohort; includes deliberate fault tests):

distinct reminded leads: 386

sink only approvals: 6

smtp accepted by local sink: 13

accepted after retry: 1

failed or uncertain send events: 4

Controlled comparison

Manual reviews at hours 12 and 24; hourly automation scan; identical assumed two-hour owner response. No sales or revenue outcome modeled.

Owner actions are predetermined scenario assumptions. Application contact/recovery rules execute locally; n8n/SMTP receipt does not cause the simulated contacts.

manual: 20/40 modeled contacts (50%); 20 incomplete due tasks.

automation: 34/40 modeled contacts (85%); 6 incomplete due tasks.

Raw overdue remains unchanged without next-action rescheduling. Local rule runtime is measured computation, not human time saved.

Limits and next measurement

Estimated pipeline exposure is neither recovered nor lost revenue. Current Won includes synthetic fixtures. Source comparisons are descriptive, not causal. Job counts include induced faults and retries; no production reliability or distributed exactly-once claim is made.

A permissioned pilot should measure owner action and rescheduling rates, actual administrative effort, and recurring operating costs before making efficiency or financial claims. Local single-user scope only.

Cost / benefit scenario

Illustrative assumptions, not observed savings, cash flow, vendor prices or ROI. Hardware, electricity and licensing costs are not measured; capacity value is not revenue.

Assume 200 actions/month, INR 300/hour capacity value, 24 setup hours, 4 maintenance hours/month, amortized over 12 months. These are editable scenario inputs, not measurements.

Assumed minutes saved/action	Capacity hours/month	Net capacity-equivalent INR/month
1	3.33	-800
2	6.67	200
3	10.0	1,200

Evidence boundaries

Historical Phase 3 evidence: 19 real integration checks. Phase 4 final regression: 51 PostgreSQL tests and 49 SQLite passes/two skips. These historical counts are not newly executed Phase 5 tests. Current report metadata records exact export and screenshot hashes.
